(54) Substituted derivatives of piperazinylcamphorsulfonyloxytocin antagonists.

(57) Compounds of the formula:

wherein R is oxime, hydroxy, halogen, cyclic epoxide, alkylcarbonyloxy, alkoxy carbonylalkoxy, trihaloalkylsulfonyloxo, or unsubstituted or substituted oxo, where said substituent is unsubstituted or substituted saturated 6-membered heterocyclic rings having 1 or 2 heteroatoms which are N, and said substituent is alkyl.

The compounds of formula I are oxytocin antagonists useful in the treatment of premature labor, dysmenorrhea and for the stoppage of labor preparatory to cesarean delivery. Also disclosed are pharmaceutical compositions containing these compounds, methods of their use and methods of their preparation.

EP 0 533 242 A2

FIELD OF THE INVENTION

The present invention provides novel compounds, novel compositions, methods of their use and methods of their manufacture, such compounds generally pharmacologically useful as agents in obstetric and gynecologic therapy. The aforementioned pharmacologic activities are useful in the treatment of mammals. More specifically, the compounds of the present invention can be used in the treatment of preterm labor, stopping labor preparatory to Cesarean delivery, and in the treatment of dysmenorrhea. At the present time, there is a need in the area of obstetric and gynecologic therapy for such agents.

10 BACKGROUND OF THE INVENTION

In the field of obstetrics, one of the most important problems is the management of preterm labor. A significant number of the pregnancies progressing past 20 weeks of gestation experience premature labor and delivery, which is a leading cause of neonatal morbidity and mortality. Despite major advances in neonatal care, retention of the fetus in utero is preferred in most instances.

Tocolytic (uterine-relaxing) agents that are currently in use include β_2 -adrenergic agonists, magnesium sulfate and ethanol. Ritodrine, the leading β_2 -adrenergic agonist, causes a number of cardiovascular and metabolic side effects in the mother, including tachycardia, increased renin secretion, hyperglycemia (and reactive hypoglycemia in the infant). Other β_2 -adrenergic agonists, including terbutaline and albuterol have side effects similar to those of ritodrine. Magnesium sulfate at plasma concentrations above the therapeutic range of 4 to 8 mg/dL can cause inhibition of cardiac conduction and neuromuscular transmission, respiratory depression and cardiac arrest, thus making this agent unsuitable when renal function is impaired. Ethanol is as effective as ritodrine in preventing premature labor, but it does not produce a corresponding reduction in the incidence of fetal respiratory distress that administration of ritodrine does.

It has been proposed that a selective oxytocin antagonist would be the ideal tocolytic agent. In the last few years, evidence has accumulated to strongly suggest that the hormone oxytocin is the physiological initiator of labor in several mammalian species including humans. Oxytocin is believed to exert this effect in part by directly contracting the uterine myometrium and in part by enhancing the synthesis and release of contractile prostaglandins from the uterine endometrium/decidua. These prostaglandins may, in addition, be important in the cervical ripening process. By these mechanisms, the process of labor (term and preterm) is initiated by a heightened sensitivity of the uterus to oxytocin, resulting in part as a result of a well-documented increase in the number of oxytocin receptors in this tissue. This "up-regulation" of oxytocin receptors and enhanced uterine sensitivity appears to be due to trophic effects of rising plasma levels of estrogen towards term. By blocking oxytocin, one would block both the direct (contractile) and indirect (enhanced prostaglandin synthesis) effects of oxytocin on the uterus. A selective oxytocin blocker, or antagonist, would likely be more efficacious for treating preterm labor than current regimens. In addition, since oxytocin at term has major effects only on the uterus, such an oxytocin antagonizing compound would be expected to have few, if any, side effects.

The compounds of the present invention can also be useful in the treatment of dysmenorrhea. This condition is characterized by cyclic pain associated with menses during ovulatory cycles. The pain is thought to result from uterine contractions and ischemia, probably mediated by the effect of prostaglandins produced in the secretory endometrium. By blocking both the direct and indirect effects of oxytocin on the uterus, a selective oxytocin antagonist can be more efficacious for treating dysmenorrhea than current regimens.

It is, therefore, a purpose of this invention to provide substances which more effectively antagonize the function of oxytocin in disease states in animals, preferably mammals, especially in humans. It is another purpose of this invention to prepare novel compounds which more selectively inhibit oxytocin. It is still another purpose of this invention to provide a method of antagonizing the functions of oxytocin in disease states in mammals. It is also a purpose of this invention to develop a method of preventing or treating oxytocin-related disorders of preterm labor and dysmenorrhea by antagonizing oxytocin.

It has now been found that compounds of formula I are antagonists of oxytocin and bind to the oxytocin receptor. When the oxytocin receptor is bound by the compounds of the present invention, oxytocin is antagonized by being blocked from its receptor and thus being unable to exert its biologic or pharmacologic effects. These compounds are useful in the treatment and prevention of oxytocin-related disorders of animals, preferably mammals and especially humans. These disorders are primarily preterm labor and dysmenorrhea. The compounds would also find usefulness for stoppage of labor preparation to Cesarean delivery.

The compounds of the present invention are those of the general structural formula:

and the pharmaceutically acceptable salts thereof,

X is

- (1) carbonyl or
- (2) sulfonyl;

Y is

- (1) hydrogen,
- (2) alkyl or
- (3) NH;

Z is

- (1) C or
- (2) N;

R¹ and R² are independently

- (1) hydrogen,
- (2) halogen,
- (3) alkoxy,
- (4) alkylsulfonyl or

(5) unsubstituted or substituted alkyl wherein said substituent is

- amino,
- alkyl, or
- dialkylamino;

R³ and R⁴ are independently

- (1) hydrogen,
- (2) alkyl,
- (3) substituted alkyl when said substituent is

- amino
- alkylsulfonyl,

50 arylsulfonyl,

- alkylamino, or
- dialkylamino;

- (4) phenylalkyl or
- (5) oxo;

55 R⁵ is

- (1) hydrogen or
- (2) oxo

R⁶ and R⁷ are independently

(1) hydrog n,
(2) alkyl or
(3) joined to form unsubstituted or substituted cycloalkyl where said substituent is
hydroxy or
hydroxyalkyl;

5 R⁸, R⁹ and R¹⁰ are independently
(1) hydrogen,
(2) oxime,
(3) hydroxy,
10 (4) halogen,
(5) cyclic epoxide,
(6) alkylcarbonyloxy,
(7) alkoxy carbonylalkoxy,
(8) trihaloalkylsulfonyloxy,
15 (9) unsubstituted or substituted 5 or 6-membered heterocyclic rings containing 1,2 or 3 heteroatoms
where said heteroatom is N,S or O and said substituents are one or more of
oxo or,
C₁-6 alkyl, optionally substituted by
alkylthio
20 alkylsulfinyl
alkylsulfonyl
cyano
carboxy,
hydroxy
25 amine,
alkylamine
dialkylamine
alkoxy
aminocarbonyl,
30 tetrazolyl
imidazole and
spiro-piperidinyl where the piperidine N is unsubstituted or substituted by C₁-6 alkyl;
(10) unsubstituted, mono- or di-substituted phenyl where said substituents are independently one or
more of
35 halogen,
carboxy,
alkoxycarbonyl,
carboxyalkyl,
amino,
40 alkylamino,
dialkylamino,
cyano,
alkylsulfonylamino,
aminoalkyl,
45 alkylaminoalkyl,
dialkylaminoalkyl; and

m, n, p and q are integers of from 0 to 2.
More particularly preferred compounds are those of the general structural Formula

50

55

and the pharmaceutically acceptable salts thereof.

X is

- (1) carbonyl or
- (2) sulfonyl;

Y is

- (1) hydrogen,
- (2) alkyl or
- (3) NH;

Z is

- (1) C or
- (2) N;

R^1 and R^2 are independently

- (1) hydrogen,
- (2) halogen,
- (3) alkoxy,
- (4) alkylsulfonyl or
- (5) unsubstituted or substituted alkyl wherein said substituent is

amino,

alkylamino or
dialkylamino;

R^3 and R^4 are independently

- (1) hydrogen,
- (2) alkyl,

45 (3) substituted alkyl where said substituent is
amino

alkylsulfonyl,

aryl sulfonyl,

alkylamino, or

50 dialkylamino;

- (4) phenylalkyl or

- (5) oxo;

R^5 is

- (1) hydrogen or
- (2) oxo;

R^6 and R^7 are independently

- (1) hydrogen,
- (2) alkyl or

(3) joined to form unsubstituted or substituted cycloalkyl where said substituent is
 hydroxy or
 hydroxyalkyl;

R⁸, R⁹ and R¹⁰ are independently

- 5 (1) hydrogen,
- (2) oxime,
- (3) hydroxy,
- (4) halogen,
- (5) oxo,
- 10 (6) cyclic epoxide,
- (7) alkylcarbonyloxy,
- (8) alkoxy carbonylalkoxy,
- (9) trihaloalkylsulfonyloxy,
- (10) unsubstituted or substituted 5-membered heterocyclic rings containing 1 or 2 heteroatoms where

15 said heteroatom is N or O and said substituents are

oxo or

C₁₋₆ alkyl, optionally substituted by

carboxy,
 amine,

20 aminocarbonyl or
 imidazole; and

m, n, p and q are integers from 0 to 2.

Most preferred are those compounds of the general formula

25

30

35

40

45

and the pharmaceutically acceptable salts thereof, wherein
 R' is an optional substituent that, when present, is H or OH;

R is

- 50 (1) hydrogen,
- (2) oxime,
- (3) hydroxy,
- (4) halogen,
- (5) cyclic epoxide,
- (6) alkylcarbonyloxy,
- 55 (7) alkoxy carbonylalkoxy,
- (8) trihaloalkylsulfonyloxy,
- (9) unsubstituted or substituted 5-membered heterocyclic rings containing 1 or 2 heteroatoms where said heteroatom is N or O and said substituents are

oxo or
 C₁₋₆ alkyl, optionally substituted by
 carboxy,
 amine,
 5 aminocarbonyl or
 imidazole.

Salts encompassed within the term "pharmaceutically acceptable salts" refer to non-toxic salts of the compounds of this invention which are generally prepared by reacting the free base with a suitable organic or inorganic acid. Representative salts include the following salts:

10

15

20

25

30

35

40

45

The term "pharmacologically effective amount" shall mean that amount of a drug or pharmaceutical agent that will elicit the biological or medical response of a tissue, system, animal or human that is being sought by a researcher or clinician.

The term "alkyl" shall mean straight or branched chain alkanes, alkenes and alkynes with one or more degrees of unsaturation at any position on the chain, of one to ten total carbon atoms, or any number within this range.

The term "aryl" shall mean phenyl, naphthyl and fluorenyl.

The term "cycloalkyl" shall mean cyclic rings of alkanes, alkenes or alkynes with one or more degrees of unsaturation at any position of the ring, of three to eight total carbon atoms.

Whenever the terms "alkyl" or "aryl" or either of their prefix roots appear in a name of a substituent (e.g. aralkoxyaryloxy) they shall be interpreted as including those limitations given above for "alkyl" and "aryl". Designated numbers of carbon atoms (e.g. C₁₋₁₀) shall refer independently to the number of carbon atoms in an alkyl or cyclic alkyl moiety or to the alkyl portion of a larger substituent in which alkyl appears

	Acetate	Lactobionate
	Benzenesulfonate	Laurate
	Benzooate	Malate
	Bicarbonate	Maleate
	Bisulfate	Mandelate
	Bitartrate	Mesylate
	Borate	Methylbromide
	Bromide	Methylnitrate
15	Calcium Edetate	Methylsulfate
	Camsylate	Mucate
	Carbonate	Napsylate
	Chloride	Nitrate
20		
25	Clavulanate	N-methylglucamine ammonium salt
	Citrate	
30	Dihydrochloride	Oleate
	Edetate	Oxalate
	Edisylate	Pamoate (Embonate)
	Estolate	Palmitate
	Esvylate	Pantothenate
	Fumarate	Phosphate/diphosphate
	Gluceptate	Polygalacturonate
	Gluconate	Salicylate
	Glutamate	Stearate
35	Glycolylarsanilate	Subacetate
	Hexylresorcinate	Succinate
	Hydrabamine	Tannate
	Hydrobromide	Tartrate
	Hydrochloride	Teoclate
	Hydroxynaphthoate	Tosylate
	Iodide	Triethiodide
	Isethionate	Valerate
40	Lactate	

as its pr fix root.

When multiple substituent moieties are disclosed or claimed, the substituted compound can be independently substituted by one or more of the disclosed or claimed substituent moieties, singly or plurally.

- 5 The term "oxo" shall refer to the substituent =O.
- The term "halogen" shall include iodine, bromine, chlorine and fluorine.
- The term "preterm labor" shall mean expulsion from the uterus of a viable infant before the normal end of gestation, or more particularly, onset of labor with effacement and dilation of the cervix before the 37th week of gestation. It may or may not be associated with vaginal bleeding or rupture of the membranes.
- 10 The term "dysmenorrhea" shall mean painful menstruation.
- The term "cesarean delivery" shall mean incision through the abdominal and uterine walls for delivery of a fetus.
- The term "substituted" shall be deemed to include multiple degrees of substitution by a named substituent.
- 15 The ability of the compounds of formula I to antagonize oxytocin makes these compounds useful as pharmacologic agents for mammals, especially for humans, for the treatment and prevention of disorders wherein oxytocin may be involved. Examples of such disorders include preterm labor and especially dysmenorrhea. These compounds may also find usefulness for stoppage of labor preparatory to Cesarean delivery.
- 20 Because of the known relationship of vasopressin to oxytocin, the compounds of the present invention are also useful as vasopressin antagonists. Vasopressin antagonists are useful in the treatment or prevention of disease states involving vasopressin disorders, including their use as diuretics and their use in congestive heart failure.
- The compounds of the present invention can be administered in such oral dosage forms as tablets, capsules (each including timed release and sustained release formulations), pills, powders, granules, elixers, tinctures, suspensions, syrups and emulsions. Likewise, they may also be administered in intravenous (both bolus and infusion), intraperitoneal, subcutaneous or intramuscular form, all using forms well known to those of ordinary skill in the pharmaceutical arts. An effective but non-toxic amount of the compound desired can be employed as a tocolytic agent.
- 25 The dosage regimen utilizing the compounds of the present invention is selected in accordance with a variety of factors including type, species, age, weight, sex and medical condition of the patient; the severity of the condition to be treated; the route of administration; the renal and hepatic function of the patient; and the particular compound or salt thereof employed. An ordinarily skilled physician or veterinarian can readily determine and prescribe the effective amount of the drug required to prevent, counter or arrest the progress of the condition.
- 30 Oral dosages of the present invention, when used for the indicated effects, will range between about 0.3-6.0 gm/day orally. Intravenously, the most preferred doses will range from 0.1 to about 10 mg/minute during a constant rate infusion. Advantageously, compounds of the present invention may be administered in a single daily dose, or the total daily dosage may be administered in divided doses of two, three or four times daily. Furthermore, preferred compounds for the present invention can be administered in intranasal form via topical use of suitable intranasal vehicles, or via transdermal routes, using those forms of transdermal skin patches well known to those of ordinary skill in that art. To be administered in the form of a transdermal delivery system, the dosage administration will, of course, be continuous rather than intermittent throughout the dosage regimen.
- 35 In the methods of the present invention, the compounds herein described in detail can form the active ingredient, and are typically administered in admixture with suitable pharmaceutical diluents, excipients or carriers (collectively referred to herein as "carrier" materials) suitably selected with respect to the intended form of administration, that is, oral tablets, capsules, elixirs, syrups and the like, and consistent with conventional pharmaceutical practices.
- 40 For instance, for oral administration in the form of a tablet or capsule, the active drug component can be combined with an oral, non-toxic pharmaceutically acceptable inert carrier such as ethanol, glycerol, water and the like. Moreover, when desired or necessary, suitable binders, lubricants, disintegrating agents and coloring agents can also be incorporated into the mixture. Suitable binders include starch, gelatin, natural sugars such as glucose or beta-lactose, corn sweeteners, natural and synthetic gums such as acacia, tragacanth or sodium alginate, carboxymethylcellulose, polyethylene glycol, waxes and the like. Lubricants used in these dosage forms include sodium oleate, sodium stearate, magnesium stearate, sodium benzoate, sodium acetate, sodium chloride and the like. Disintegrators include, without limitation, starch, methyl cellulose, agar, alginic acid and the like.

The compounds of the present invention can also be administered in the form of liposome delivery systems, such as small unilamellar vesicles, large unilamellar vesicles and multilamellar vesicles. Liposomes can be formed from a variety of phospholipids, such as cholesterol, stearylamine or phosphatidylcholines.

5 Compounds of the present invention may also be delivered by the use of monoclonal antibodies as individual carriers to which the compound molecules are coupled. The compounds of the present invention may also be coupled with soluble polymers as targetable drug carriers. Such polymers can include polyvinylpyrrolidone, pyran copolymer, polyhydroxypropylmethacrylamide-phenol, polyhydroxyethylaspartamidephenol, or polyethyleneoxidepolylysine substituted with palmitoyl residues. Furthermore, the compounds of the present invention may be coupled to a class of biodegradable polymers useful in achieving controlled release of a drug, for example, polylactic acid, polyepsilon caprolactone, polyhydroxy butyric acid, polyorthoesters, polyacetals, polydihydropyrans, polycyanoacrylates and cross-linked or amphipathic block copolymers of hydrogels.

10 The compounds of formula I can be prepared readily according to the following reaction Schemes (in which all variables are as defined before) and Examples or modifications thereof using readily available starting materials, reagents and conventional synthesis procedures. In these reactions, it is also possible to make use of variants which are themselves known to those of ordinary skill in this art, but are not mentioned in greater detail.

15 The most preferred compounds of the invention are any or all of those specifically set forth in these examples. These compounds are not, however, to be construed as forming the only genus that is considered as the invention, and any combination of the compounds or their moieties may itself form a genus. The following examples further illustrate details for the preparation of the compounds of the present invention. Those skilled in the art will readily understand that known variations of the conditions and processes of the following preparative procedures can be used to prepare these compounds. All temperatures are degrees Celsius unless noted otherwise.

TLC was performed on 20 cm plates coated with silica gel (250 microns) from Analtech.

Example 1

1-((7,7-DIMETHYL-2-OXO-BICYCLO(2.2.1)HEPTAN-1-YL)METHANESULFONYL)-4-(2-METHYLPHENYL)PIPERAZINE

To a stirred, 0 °C solution of 1-(*o*-tolyl)piperazine hydrochloride (50.0 g; 235 mmol) and TEA (83 mL; 590 mmol) in chloroform (1000 mL) was added (+)-10-camphorsulfonyl chloride (65.5 g; 260 mmol). The solution was stirred at 0 °C for 1 h and then at ambient temperature for 3 h. The solution was extracted with 5% aqueous HCl (2 x 500 mL), water (500 mL), and saturated aqueous NaHCO₃ (2 x 500 mL). The organic phase was dried (MgSO₄), filtered, and the solvent was removed under reduced pressure. The resulting solid was recrystallized from methanol to give the title compound, mp 112-114 °C (69 g; 75%).

Example 2

¹⁵ 1-((7,7-DIMETHYL-2-EXO-HYDROXY-2-ENDO-(1-CYANO)ETHYL-BICYCLO(2.2.1)HEPTAN-1-YL)-METHANESULFONYL)-4-(2-METHYL PHENYL)PIPERAZINE:

20

25

³⁰ To a stirred, -78°C solution of diisopropylamine (21.0 mL; 150 mmol) in THF (350 mL) was added n-butyllithium (60 mL of a 2.5 M solution in hexane; 150 mmol). The solution was warmed to 0°C for 15 min, then cooled to -78°C. A solution of propionitrile (10.1 mL; 141 mmol) in THF (75 mL) was added dropwise, and the resulting solution was stirred at -78°C for 45 min. A -78°C solution of 1-((7,7-dimethyl-2-oxo-bicyclo(2.2.1)heptan-1-yl)methanesulfonyl)-4-(2-methylphenyl)piperazine (50.0 g; 128 mmol) in THF (350 mL) was added via cannula, and the resulting solution was stirred at -78°C for 5 min. A solution of 5:1 THF/water (100 mL) was added and the mixture was warmed to ambient temperature. The mixture was diluted with EtOAc (500 mL) and washed with 5% aqueous citric acid (2 x 500 mL), and brine (250 mL). The organic phase was dried (MgSO₄), filtered, and the solvents were removed under reduced pressure to give a foam. The major isomer by TLC was obtained by crystallization from ether, mp 163-165°C.

50

55

To a stirred, 78°C solution of LDA (2.0 mmol) in THF (15 mL) was added a -78°C solution of 1-t-butyloxycarbonyl-4-(2-methylphenyl)-3-piperazinone (0.50 g; 1.7 mmol) in THF (5 mL). The resulting solution was stirred for 1 hour, when iodomethane (0.125 mL; 2.0 mmol) was added. The reaction mixture was stirred at -78°C for 30 minutes, and then the cooling bath was removed and the mixture was stirred at ambient temperature for 3 hours. Water (10 mL) and ethyl acetate (50 mL) were added. The organic layer

was separated and washed with water (25 mL) and brine (25 mL). The organic phase was dried (MgSO_4), filtered, and the solvent was removed under reduced pressure. The residue was purified by pressurized silica gel column chromatography using 85:15 hexane-ethyl acetate as eluent. The methylated product had an $R_f = 0.47$ (70:30 hexane-ethyl acetate) and an HPLC retention time of 8.32 min (Method A). The product (0.40 g; 1.3 mmol) was dissolved in chloroform (3 mL) and TFA (1 mL) was added. After 2 hours, the mixture was diluted with chloroform (50 mL) and extracted with aqueous NaHCO_3 (3 x 25 mL). The organic phase was dried (MgSO_4), filtered, and the solvent was removed under reduced pressure to give an oil (HPLC retention time 2.95 min, Method A). The residue was dissolved in chloroform (20 mL) and to the stirred solution was added 10-camphorsulfonyl chloride (0.41 g; 1.6 mmol) and triethylamine (0.28 mL; 2.0 mmol). After 12 hours, the mixture was diluted with chloroform (25 mL) and extracted with 5% aqueous HCl (25 mL), water (25 mL), and aqueous NaHCO_3 (2 x 25 mL). The organic phase was dried (MgSO_4), filtered, and the solvent was removed under reduced pressure. The residue was purified by pressurized silica gel column chromatography using 2:1 hexane-ethyl acetate as eluent. The title compound, as a 1:1 mixture of diastereomers, was obtained as a white solid from hexane-ether.

45 To a stirred, 0°C solution of 1-((7,7-dimethyl-2-oxo-bicyclo(2.2.1)heptan-1-yl)methanesulfonyl)-4-(2-methyl-phenyl)-2-methyl-3-piperazinone (0.15 g; 0.36 mmol) in THF (5 mL) was added a 1.0 M solution of LAH in THF (1.1 mL; 1.1 mmol). The resulting solution was warmed to ambient temperature and stirred for 3 hours. The reaction was quenched by adding aqueous NaOH to give a white precipitate. The mixture was diluted with ethyl acetate and the solids were removed by filtration through Celite. The filtrate solvents were removed under reduced pressure and the residue was purified by pressurized silica gel column chromatography using 9:1 hexane-ethyl acetate as eluent to give 1-((7,7-dimethyl-2-exo-hydroxy-bicyclo(2.2.1)heptan-1-yl)methanesulfonyl)-4-(2-methylphenyl)-2-methyl-2,3-dehydro-piperazine (FAB MS: $m/z = 405$ ($\text{M}^+ + \text{H}$); olefinic proton at 5.8 ppm in the ^1H NMR spectrum). This product (75 mg; 0.19 mmol) was dissolved in triethylsilane (2 mL) and to the stirred solution was added TFA (0.030 mL; 0.38 mmol). After 18 hours, the solvents were removed under reduced pressure and the residue was dissolved in ethyl acetate (20 mL) and washed with aqueous NaHCO_3 (2 x 10 mL). The organic phase was dried (MgSO_4), filtered, and the solvent was removed under reduced pressure. The residue was purified by preparative reverse phase HPLC using an acetonitrile-water gradient containing 0.1% TFA. The title compound, as a 1:1 mixture of diastereomers,

was obtained as a lyophilized powder.

5

20 To a stirred solution of 1-((7,7-dimethyl-2-oximino-bicyclo(2.2.1)heptan-1-yl)methanesulfonyl)-4-(2-methylphenyl)piperazine (35.0 g; 86 mmol) in 2-methoxyethanol (500 mL) containing Raney Nickel alloy (105.0 g) was added sodium hydroxide solution (17.2 g; 430 mmol dissolved in 75 mL) dropwise over 30 min. During the addition heat and gas was evolved. The mixture was stirred at ambient temperature for 16 h, at which time TLC indicated complete consumption of starting oxime and a ca. 4:1 mixture of endo (lower Rf and exo (higher Rf) amine products. The mixture was filtered through Celite and the filter-cake was washed with methanol and ethyl acetate. The solvents were removed under reduced pressure and the resulting solid was dispersed in water and filtered. The dried solid was purified by pressurized silica gel column chromatography, using a 93:3 to 94:6 A:B gradient elution (A = chloroform, B = 5% NH₄OH/MeOH). The title compound was obtained as a white foam (24 g; 70%).

FAB MS: m/z 500 ($M^+ + H$)EXAMPLE 445 1-((7,7-DIMETHYL-2-ENDO-(2-(4-IMIDAZOLYL)PROPANOYL)AMINO-BICYCLO(2.2.1)HEPTAN-1-YL)-
METHANESULFONYL)-4-(2-METHYLPHENYL)-3-PIPERAZINE

10 To a stirred solution of 1-((7,7-dimethyl-2-endo-amino-bicyclo(2.2.1)heptan-1-yl)methanesulfonyl)-4-(2-methylphenyl)piperazine (1.1 g; 2.8 mmol) in DMF (25 mL) was added 2-(1-benzyloxymethyl-5-imidazolyl)-propionic acid hydrochloride (0.920 g; 3.10 mmol), BOP (1.35 g; 3.05 mmol), and DIEA (1.50 mL; 8.61 mmol). The reaction mixture was stirred for 1 h at ambient temperature, and more DIEA (ca. 0.2 mL) was added to bring the mixture to pH 8. After another 1 h, the solvent was removed under reduced pressure. The residue was dissolved in CHCl₃ (150 mL) and washed with aqueous NaHCO₃ (2 x 50 mL) and water (2 x 50 mL). The organic phase was dried (MgSO₄), filtered, and the solvent was removed under reduced pressure to give a solid. Recrystallization from EtOAc gave crystals (0.51 g) which, by ¹H NMR analysis, proved to be a 90:10 mixture of isomers (product A). The filtrate was purified by pressurized silica gel column chromatography using 95:5 CHCl₃:MeOH as eluant, giving a white foam (1.0 g). ¹H NMR indicated this material to be a 1:2 mixture of isomers (product B). Products A and B were individually deblocked by hydrogenation for 24 h at ambient temperature in 3:1 MeOH:HOAc using 25 weight% palladium black under 1 atmosphere of hydrogen. The catalyst was removed by filtration through Celite and the solvents were removed under reduced pressure. Catalyst was removed by filtration through Celite, and the filtrate solvents were removed under reduced pressure. The residue derived from product A was purified by preparative reverse phase HPLC using a water-acetonitrile gradient containing 0.1% TFA. The TFA salt of the title compound (90:10 mixture by ¹H NMR) was obtained as a lyophilized powder. Product B was purified by pressurized silica gel column chromatography using 95:5:0.5 CHCl₃:MeOH:NH₄OH as eluant. The title compound was obtained as white foam from CHCl₃-ether (1:2 mixture by ¹H NMR). The two isomers had identical chromatographic behavior.

TABLE

In addition to those compounds specifically exemplified above, additional compounds of the present invention are set forth in tabular form below. These compounds are synthesized by use of the synthetic routes and methods described in the above Schemes and Examples and variations thereof well known to those of ordinary skill in the art, and not requiring undue experimentation. All variables listed in the Tables below are with reference to the following generic structure:

45 EXAMPLE 33RADIOGLAND BINDING ASSAYS

The high affinity binding of [³H] Oxytocin (OT)([tyrosyl, 3,5-[³H]OT; 30-60 Ci/mmol; New England Nuclear, Boston, MA) to uterine OT receptors was based on an assay* using a crude membrane preparation of uteri taken from diethylstilbestrol dipropionate (DES)-treated (0.3 mg/kg, ip; 18-24) rats. Competition studies were conducted at equilibrium (60 minutes; 22°C) using 1 nM [³H]OT in the following assay buffer: 50 mM Tris-HCl, 5 mM MgCl₂, and 0.1% BSA, pH 7.4. Non-specific binding (10% of the total binding) was determined using 1 μM unlabeled OT and the binding reaction was terminated by filtration through glass fiber filters using a cell harvester (model 7019, Skatron, Inc., Sterling, VA). IC₅₀ (the concentration of tested compound that inhibits 50% of OT) was reported, unless otherwise noted.

* Fuchs, A-R; Fuchs, F; Soloff, MS. 1985 J. Clin. Endocrinol. Metab. 60:37.

The measurement of [³H]Vasopressin (AVP) ([phenylalanyl-3,4,5-³H]AVP; 80-90 Ci/mmol; New England Nuclear) binding to a crude membrane preparation of male rat liver (AVP-V₁ sites) or kidney medulla (AVP-V₂ sites) was determined according to the method of Butler, et al.^{**} Competition assays were conducted at equilibrium (30 minutes at 30°C) using 1 nM [³H]AVP (liver) or 2 nM [³H]AVP (kidney) in the following assay buffer: 100 mM Tris-HCl, 5 mM MgCl₂, 0.1% BSA, 50 μM phenylmethylsulfonylfluoride, and 50 μg/ml bacitracin, pH 8.0. Nonspecific binding (5-10% of the total binding) was determined using 10 μM unlabeled AVP, and the binding reaction was terminated by filtration as described above for the [³H]OT binding assay.

K_i values were obtained for each compound from three to six separate determinations of the IC₅₀ values (K_i = IC₅₀/I + c/K_d)^{***} using K_d values obtained from saturation binding assay: [³H]OT (uterus), 0.7 nM; [³H]AVP (liver), 0.4 nM; [³H] (kidney), 1.4 nM.

While the invention has been described and illustrated with reference to certain preferred embodiments thereof, those skilled in the art will appreciate that various changes, modifications and substitutions can be made therein without departing from the spirit and scope of the invention. For example, effective dosages other than the preferred dosages as set forth hereinabove may be applicable as a consequence of variations in the responsiveness of the mammal being treated for prevention of preterm labor, or for other indications for the compounds of the invention indicated above. Likewise, the specific pharmacological responses observed may vary according to and depending upon the particular active compound selected or whether there are present pharmaceutical carriers, as well as the type of formulation and mode of administration employed, and such expected variations or differences in the results are contemplated in accordance with the objects and practices of the present invention. It is intended, therefore, that the invention be limited only by the scope of the claims which follow and that such claims be interpreted as broadly as is reasonable.

40

Claims

1. A compound of the formula:

45

50

55

and the pharmaceutically acceptable salts thereof, wherein

X is

- (1) carbonyl or
- (2) sulfonyl;

Y is

- (1) hydrogen,
- (2) alkyl or
- (3) NH;

Z is

- (1) C or
- (2) N;

R¹ and R² are independently one or more of

- (1) hydrogen,
- (2) halogen,
- (3) alkoxy,
- (4) alkylsulfonyl or
- (5) unsubstituted or substituted alkyl wherein said substituent is
amino,
alkyl, or
dialkylamino;

R³ and R⁴ are independently one or more of

- (1) hydrogen,
- (2) alkyl,
- (3) substituted alkyl where said substituent is
amino,
alkylsulfonyl,
arylsulfonyl,
alkylamino or
dialkylamino;
- (4) phenylalkyl or
- (5) oxo;

R⁵ is

(1) hydrogen or
 (2) oxo;
 R⁶ and R⁷ are independently on or more of
 (1) hydrogen,
 5 (2) alkyl or
 (3) joined to form unsubstituted or substituted cycloalkyl where said substituent is
 hydroxy or
 hydroxyalkyl;

R⁸, R⁹ and R¹⁰ are independently one or more of
 10 (1) hydrogen,
 (2) oxime,
 (3) hydroxy,
 (4) halogen,
 (5) cyclic epoxide,
 15 (6) alkylcarbonyloxy,
 (7) alkoxy carbonylalkoxy,
 (8) trihaloalkylsulfonyloxo,
 (9) unsubstituted or substituted 5 or 6-membered heterocyclic rings containing 1,2 or 3 heteroatoms
 where said heteroatom is N,S or O and said substituents are one or more of
 20 oxo or,
 C₁₋₆ alkyl, optionally substituted by
 alkylthio
 alkylsulfinyl
 alkylsulfonyl
 25 cyano
 carboxy,
 hydroxy
 amine,
 alkylamine
 30 dialkylamine
 alkoxy
 aminocarbonyl,
 tetrazolyl
 imidazole and
 35 spiro-piperidinyl where the piperidine
 N is unsubstituted or substituted by
 C₁₋₆ alkyl;
 (10) unsubstituted, mono- or di-substituted phenyl where said substituents are independently one or
 more of
 40 halogen,
 carboxy,
 alkoxy carbonyl,
 carboxyalkyl,
 amino,
 45 alkylamino,
 dialkylamino,
 cyano,
 alkylsulfonylamino,
 aminoalkyl,
 50 alkylaminoalkyl,
 dialkylaminoalkyl; and
 m, n, p and q are integers of from 0 to 2.

2. A compound of the formula:

and the pharmaceutically acceptable salts thereof, wherein

x is

30 (1) carbonyl or
(2) sulfonyl;

Y is

35 (1) hydrogen,
 (2) alkyl or
 (3) NH;

Z is

(1) C or
(2) N;

R¹ and R² are independently one or more of

40 (1) hydrogen,
 (2) halogen,
 (3) alkoxy,
 (4) alkylsulfonyl or
 (5) unsubstituted or substituted alkyl wherein said substituent is
45 amino,
 alkylamino or
 dialkylamino:

R^3 and R^4 are independently one or more of

(5) oxo;
 R⁵ is
 (1) hydrogen or
 (2) oxo;

5 R⁶ and R⁷ are independently one or more of
 (1) hydrogen,
 (2) alkyl or
 (3) joined to form unsubstituted or substituted cycloalkyl where said substituent is
 hydroxy or
 10 hydroxyalkyl;

R⁸, R⁹ and R¹⁰ are independently one or more of
 (1) hydrogen,
 (2) oxime,
 (3) hydroxy,
 15 (4) halogen,
 (5) oxo,
 (6) cyclic epoxide,
 (7) alkylcarbonyloxy,
 (8) alkoxycarbonylalkoxy,
 20 (9) trihaloalkylsulfonyloxo,
 (10) unsubstituted or substituted 5-membered heterocyclic rings containing 1 or 2 heteroatoms
 where said heteroatom is N or O and said substituents are
 oxo or
 C₁-₆ alkyl, optionally substituted by
 25 carboxy,
 amine,
 aminocarbonyl or
 imidazole; and
 m, n, p and q are integers from 0 to 2.

30 3. A compound of the formula:

and the pharmaceutically acceptable salts thereof, wherein

55 R is
 (1) hydrogen,
 (2) oxime,

(3) hydroxy,
(4) halogen,
(5) cyclic epoxide,
5 (6) alkylcarbonyloxy,
(7) alkoxy carbonylalkoxy,
(8) trihaloalkylsulfonyloxo,
(9) unsubstituted or substituted 5-membered heterocyclic rings containing 1 or 2 heteroatoms where
said heteroatom is N or O and said substituents are independently one or more of
oxo or,
10 C₁-₆ alkyl, optionally substituted by
carboxy,
amine,
aminocarbonyl or,
imidazole

15 4. A pharmaceutical composition comprising a pharmaceutically acceptable carrier and a compound as
claimed in claim 1 in an amount sufficient to antagonize the binding of oxytocin to its receptor binding
site.

20 5. A pharmaceutical composition comprising a pharmaceutically acceptable carrier and a compound as
claimed in claim 1 in an amount sufficient to prevent preterm labor in a mammal.

6. A pharmaceutical composition comprising a pharmaceutically acceptable carrier and a compound as
claimed in claim 1 in an amount sufficient to stop labor prior to cesarian delivery in a mammal.

25 7. A pharmaceutical composition comprising a pharmaceutically acceptable carrier and a compound as
claimed in claim 1 in an amount sufficient to treat dysmenorrhea.

8. The use of a compound as claimed in claim 1 for the manufacture of a medicament for antagonizing
30 claim 1 in an amount sufficient to treat dysmenorrhea in a mammalian biologic system.

9. The use of a compound as claimed in claim 1 for the manufacture of a medicament for preventing
preterm labor in a mammal.

35 10. The use of a compound as claimed in claim 1 for the manufacture of a medicament for stopping labor
prior to cesarian delivery in a mammal.

11. The use of a compound as claimed in claim 1 for the manufacture of a medicament for treating
dysmenorrhea in a mammal.
